UID EX 6

RAD (Rapid Application Development) is a software development methodology that emphasizes quick development and iteration of prototypes over strict planning and long development cycles. It is ideal for projects where requirements evolve through user feedback and where fast delivery is important.

Key Characteristics of RAD:

- Focus on prototypes instead of extensive documentation
- User involvement throughout the development process
- Fast development cycles with frequent iterations
- Reusable components to reduce effort
- Best suited for UI/UX-intensive projects like web and mobile apps

Phase 1: Requirements Planning

This is where the project goals, system requirements, and user needs are identified. Stakeholders, users, and designers collaborate to decide what needs to be built.

1) Identify Key Features

Navigation:

- Login / Sign Up
- Home (Restaurants Near You)
- Restaurant Menu
- Cart
- Delivery Address
- Choose Delivery Option
- Order Tracking
- Proof of Delivery

User Actions: Browsing, Searching, Adding to Cart, Checkout, Tracking Orders, Confirming Delivery

2) Create a Requirements Document:

1. Login or Sign Up to access the app
2. View list of restaurants near the user with ratings and distance
3. Browse menu items under each restaurant with prices and Add to Cart option
4. View and manage cart with order summary and total price
5. Enter delivery address with street, city, ZIP, phone, and special instructions
6. Choose delivery option: Standard, Express, or Scheduled
7. Track order status in real time with driver details
8. Confirm delivery with signature and optional photo

Phase 2: User Design

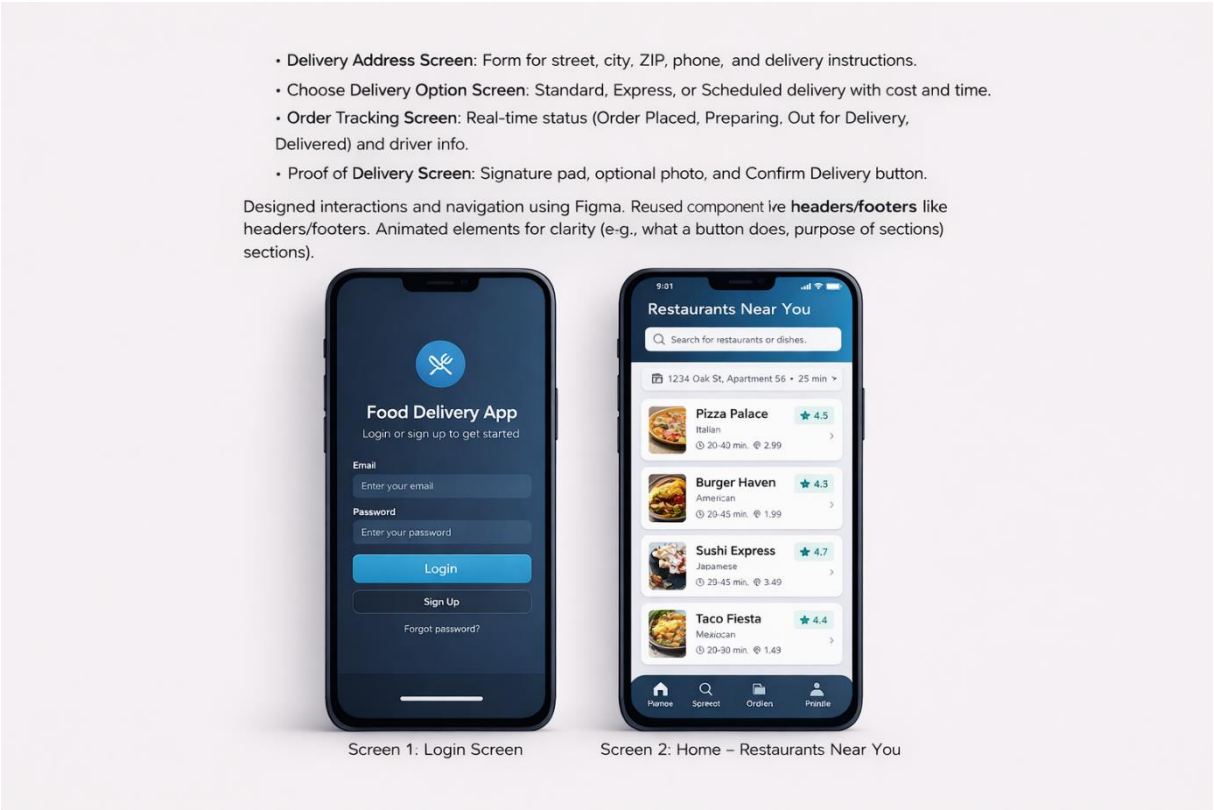
Designers and users collaborate to create wireframes and prototypes. The idea is to show how the application will look and behave before any actual coding starts.

1) Tools Used: Axure RP — Used to design the wireframes and UI prototype.

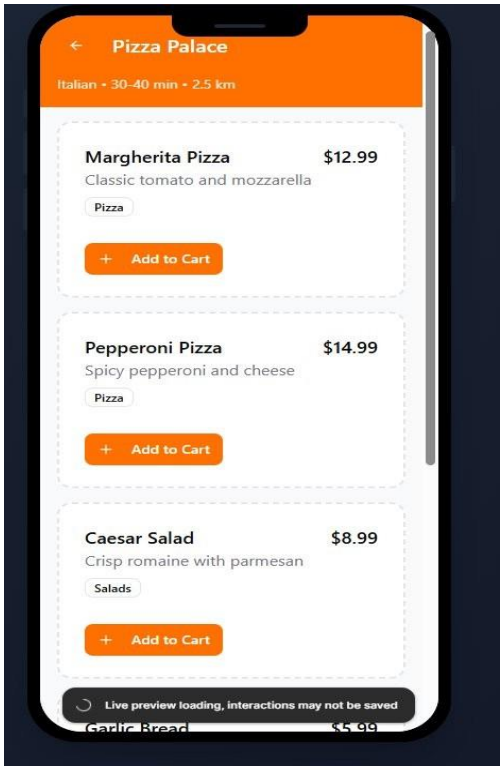
2) Wireframes Designed:

- Login Screen: Email and password fields with Login and Sign Up buttons.
- Home Screen: Lists nearby restaurants with ratings, delivery time, and distance.
- Menu Screen: Shows food items with name, price, category tag, and Add to Cart button.
- Cart Screen: Displays selected items with quantity, price breakdown, and Proceed to Checkout.
- Delivery Address Screen: Form for street, city, ZIP, phone, and delivery instructions.
- Choose Delivery Option Screen: Standard, Express, or Scheduled delivery with cost and time.
- Order Tracking Screen: Real-time status (Order Placed, Preparing, Out for Delivery, Delivered) and driver info.
- Proof of Delivery Screen: Signature pad, optional photo, and Confirm Delivery button.

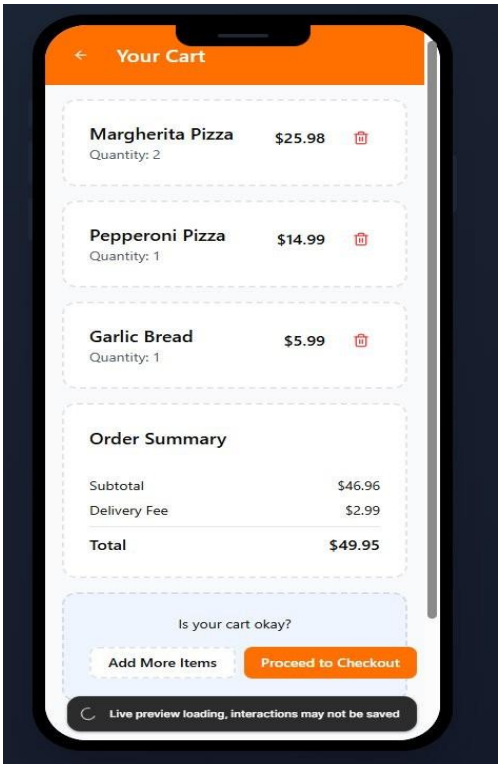
Designed interactions and navigation using Axure's Prototype mode. Reused components like headers/footers using Masters. Annotated elements for clarity (e.g., what a button does, purpose of sections).



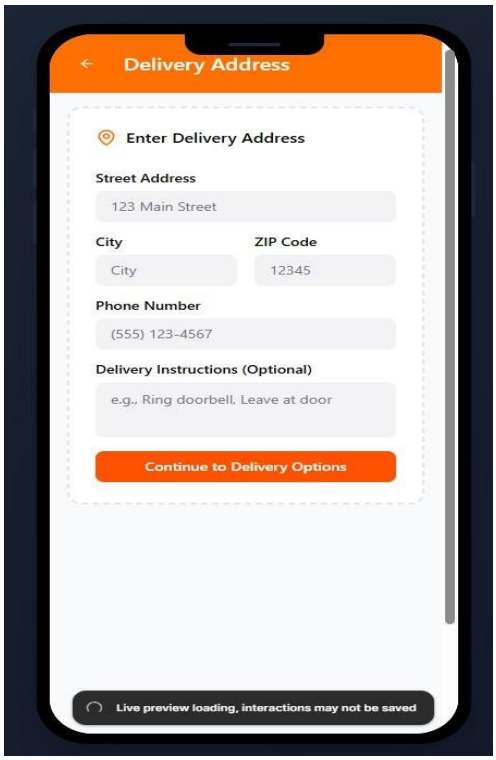
Screen 1: Login Screen *Screen 2: Home – Restaurants Near You*



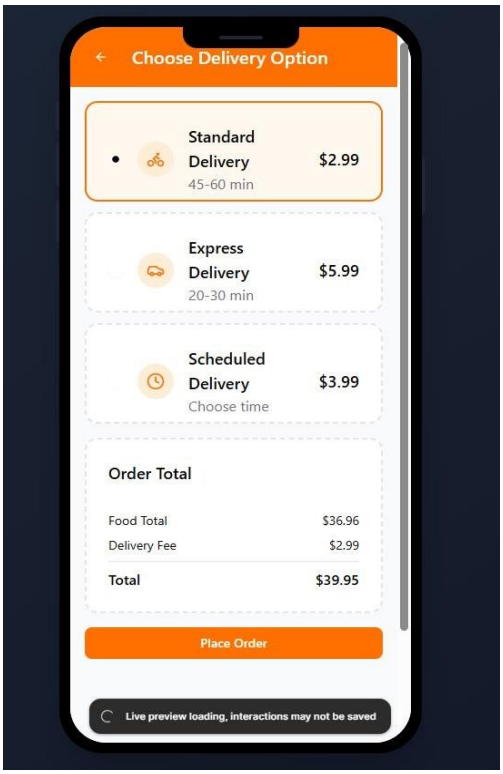
Screen 3: Menu Screen (Pizza Palace)



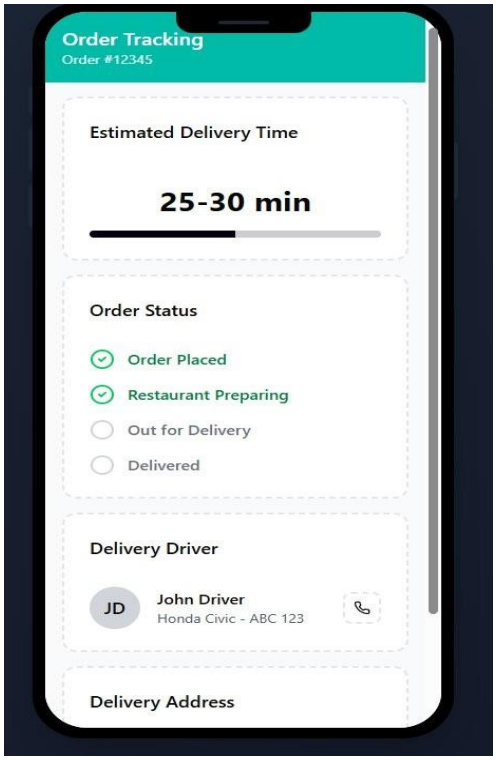
Screen 4: Cart Screen



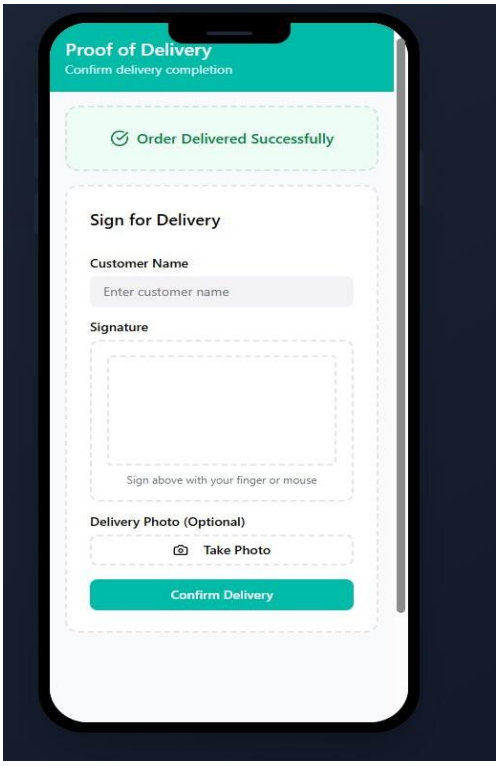
Screen 5: Delivery Address



Screen 6: Choose Delivery Option



Screen 7: Order Tracking



Screen 8: Proof of Delivery

Phase 3: Construction

This is where the actual development happens, but in RAD, it is tightly coupled with ongoing testing and feedback. The prototype is refined based on user responses.

1) Interactive Prototypes:

- Created using Axure's prototype linking features.
- Functional paths designed:
  - o Login → Home (Restaurants Near You) → Menu → Add to Cart → Cart → Delivery Address → Choose Delivery Option → Order Tracking → Proof of Delivery

2) Dynamic Elements:

- Simulated transitions between screens for adding to cart and checking out.
- Screens simulate real-time behavior such as navigating between restaurant listings and the cart.
- Order tracking progress bar and status steps created with dynamic panels.
- Signature pad on Proof of Delivery screen simulates interactive input.

3) Testing and Iteration:

- Prototype previewed using Axure's "Present" / Live Preview mode.
- Collected feedback from stakeholders (assumed for documentation).
- Iterated based on visual hierarchy, accessibility, and flow suggestions.

Phase 4: Cutover

In this final phase, the system goes live. This includes finalizing the design, training users, and preparing documentation for developers.

1) Finalization and Export:

- Final design prototype shared through Axure Cloud link.
- Ready for hand-off to the development team.
- Can be exported to HTML/CSS using Axure's built-in publish features.

2) User Training and Support:

- Walkthrough of the prototype for stakeholders or development team.
- Notes/documentation provided for developers to understand functionality and user flow.
- Easy access to Axure comments for further collaboration and questions.
